Guidance Instruction: generate a solution to the problem by performing the necessary mathematical calculations based on the given scenario and then provide the final result.

Instruction: generate a solution to the problem by performing the necessary mathematical calculations based on the given scenario and then provide the final result.
Question: Geb is 10 **less** than **half** the **age** of Haley. If Haley is 26 **years** old, how old is Geb?

LLMs as Answer Models

Output: First, we need to find half of Haley's age: Half of Haley's age = $26 / 2 = 13$. Now Geb is 10 less than half of Haley's age: $Geb = 13 - 10 = 3$
Therefore, Geb is 3 years old.
